ABSTRACT

The Bureau of the Census collected information on age, residence, employment status, occupation, and income in March 1980 as a supplement to its monthly Current Population Survey. Data indicated that in March 1980 there were about 13.2 million persons of Spanish origin in the United States. Of these, there were about 60% of Mexican origin, 14% of Puerto Rican origin, 6% of Cuban origin, 8% of Central or South American origin, and about 12% of other Spanish origin. About 84% of all Spanish-origin families resided in metropolitan areas. The median age of Hispanic persons was 22 years. About 13% of the Spanish-origin population was under 5 years of age and about 4% were 65 years old and over. About 5 million Spanish-origin persons were in the civilian labor force. The unemployment rate for Spanish-origin persons was higher (8.9%) than that for non-Spanish persons (6.5%). Only about 9% of Spanish-origin persons were working in professional occupations, 24% worked as operatives, and abut 3% were employed as farm laborers. The median income in 1979 was \$14,600 for Hispanic families and \$20,000 for non-Spanish origin persons. Differences in family income were also evident in 1979 by type of Spanish origin. (NQA)

Persons of Spanish Origin in the United States: March 1980 (Advance Report)

NOTE

The estimates of the Spanish-origin population in this report will not agree with the counts from the 1980 census of population. The provisional 1980 count of the Spanish-origin population is 14.6 million. The Current Population Survey (CPS) estimate for March 1980 of 13.2 million is based on population controls from the 1970 census which have been updated for changes in the population since that time. In addition, the CPS and the 1980 census used different procedures for collecting information and processing the data for the Spanish-origin population. Furthermore, the CPS estimate represents the civilian noninstitutional population whereas the census count is for the total resident population.

The March 1980 CPS estimates will be retabulated based on 1980 census population controls. These revised CPS estimates will be presented in a subsequent Current Population Report.

This report presents advance data on the demographic, social, and economic characteristics of persons of Spanish origin¹ in the United States. This information was collected by the Bureau of the Census in March 1980 as a supplement to its monthly Current Population Survey (CPS). Characteristics presented include age, residence, employment status, occupation, and income.

In March 1980, the number of persons of Spanish origin in the United States totaled about 13.2 million.² About 60 percent of these persons were of Mexican origin, 14 percent were of Puerto Rican origin, 6 percent were of Cuban origin, 8 percent were of Central or South American origin, and about 12 percent were of other Spanish origin. (See note and table 1.)

Most families of Spanish origin lived in metropolitan areas. In March 1980, about 84 percent of all Spanish-origin families resided in metropolitan areas, compared with 66 percent of families not of Spanish origin. Furthermore, differences in residential preference existed among the Spanish-origin groups; about 79 percent of Mexican-origin families were living in metropolitan areas, compared with 95 percent of Puerto Rican-origin families (table 2).

Largely as a result of higher fertility, the population of Spanish origin in the United States was a younger population than the non-Spanish population; the median age of Hispanic persons (22 years) was substantially lower than that for persons not of Spanish origin (31 years). Thirteen percent of the Spanish-origin population was under 5 years of age, compared with 7 percent for the non-Spanish population, and about 4 percent of all Hispanic persons were 65 years old and over as compared with 11 percent of non-Hispanic persons (table 3).

The number of Spanish-origin persons in the civilian labor force reached about 5 million in March 1980. The unemployment rate for these persons was higher (8.9 percent) than that for non-Spanish persons (6.5 percent). The unemployment rate also differed by type of Hispanic origin; for example, 5.0 percent of Cuban-origin persons in the civilian labor force were unemployed in March 1980, compared to 11.7 percent for Puerto Rican-origin persons.

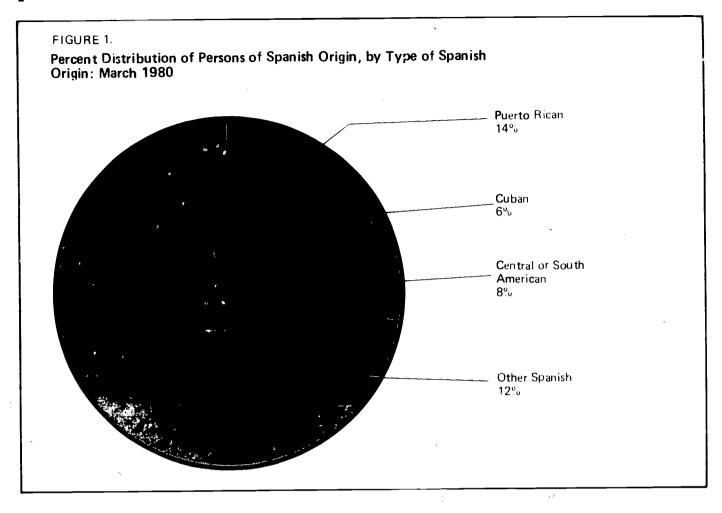

The proportion of employed Hispanic persons in higher paying jobs was lower than that for non-Hispanic persons. Only about 9 percent of Spanish persons were working in professional occupations, compared with 17 percent of non-Spanish persons; conversely, the proportion of employed Hispanic persons working as operatives (24 percent) was substantially higher than that for non-Spanish persons (14 percent). The survey showed that about 3 percent of Spanish workers were employed as farm laborers.

The median income in 1979 was lower for Hispanic families than that for families not of Spanish origin (\$14,600

The data on Spanish-origin persons from the March 1980 CPS are not completely comparable with the estimates published from the March 1979 CPS, A processing problem discovered since publication of the 1979 data indicates that about 300,000 Spanish-origin persons included in the March 1979 CPS estimates of the were not Spanish-origin population.

¹ In this report, the terms "Spanish origin," "Spanish," and "Hispanic" are used interchangeably.

and \$20,000, respectively). The lower median income for Spanish-origin families is reflected in the income distribution: 12 percent had incomes under \$5,000, and about 39 percent had incomes between \$5,000 and \$15,000. In the upper end of the income distribution, about 21 percent of Spanish families had incomes of \$25,000 or more, compared with 35 percent of non-Spanish families (table 5).

Differences in family income were also evident in 1979 by type of Sparium origin. For instance, the median income of \$17,500 for Cuban families was substantially higher than the median income of Puerto Rican families (\$9,900). A factor contributing to the low Puerto Rican family income status may be the low median number of years of educational attainment of persons maintaining Puerto Rican families.

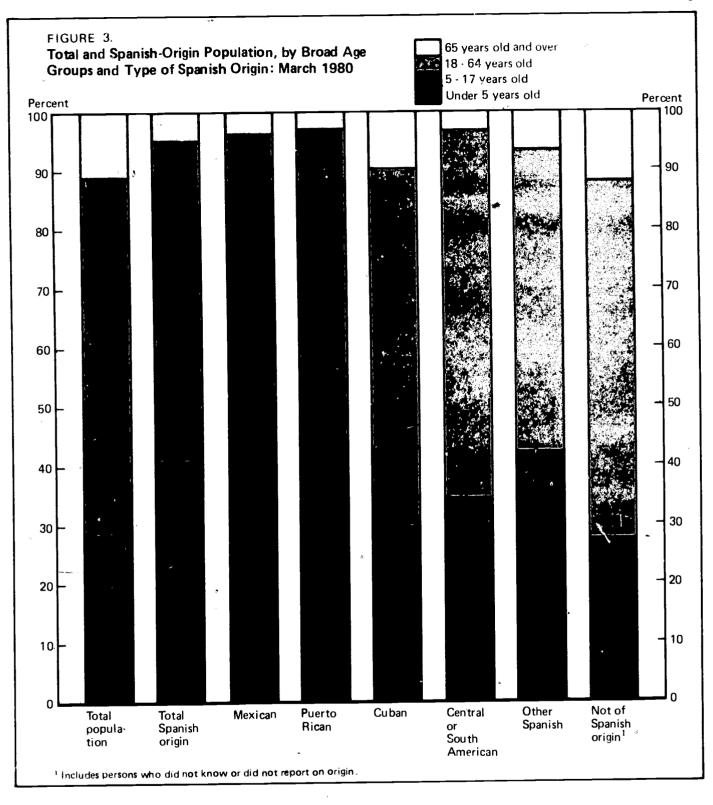

Information in this report on persons of Spanish origin was obtained from responses to the question shown in figure 2.

Persons of Spanish origin were persons who reported themselves as Mexican-American, Chicano, Mexican, Puerto Rican, Cuban, Central or South American, or other Spanish origin. Persons who reported themselves specifically as Mexican-American, Chicano, or Mexican were consolidated into the Mexican category.

Tables in this report show data for some or all of these subcategories of Spanish origin. A more inclusive report on the characteristics of these persons is forthcoming.

Since the CPS estimates are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same schedules, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey: sampling and nonsampling. The standard errors primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any

systematic biases in the data. The full extent of nonsampling error is unknown.

Standard errors are primarily measures of sampling variability, that is, of the variation that occurred by chance because a sample rather than the entire population was surveyed. The sample estimate and its estimated standard error enable one to construct confidence intervals, or ranges that would include the average result of all possible samples with a known probability. For example, if all possible

samples were selected, each surveyed under essentially the same general conditions and using the same sample design, then the 68-percent confidence interval for the total number of persons of Spanish origin would be from 12.9 to 13.6 million. Therefore, a conclusion that the average estimate derived from all possible samples lies within this range would be correct for roughly 68 percent of all possible samples. Similarly, one could conclude that the average estimate derived from all possible samples lies within the

interval from 12.6 to 13.9 million (using twice the standard error) with 95-percent confidence.

Rounding. The numbers in this report are in thousands and were rounded to the nearest thousand without being adjusted to group totals; hence, the sum of the parts may not equal the total shown. Also, because of rounding, the figures may differ slightly from table to table, and individual percentages may not always add to 100 percent.

Two New Reference Books from the Census Bureau

AGE SEARCH INFORMATION

The Census Bureau can provide authorized individuals with official transcripts of its population records from 1900 to the present that are useful for a variety of purposes—showing age, relationship, place of birth, citizenship, occupation, etc. This new manual explains what an age search can or cannot do, and suggests a variety of alternative Federal record sources. Useful to individuals, genealogists, and organizations that need such documents.

Issued May 1979, 37 pp. at \$1.70

TWENTY CENSUSES

Population and Housing Questions, 1790-1980

This volume replaces the Census Bureau's earlier Working Paper 39, now out of print. The new edition, which is limited to existing schedules and questionnaires open to the public as well as those closed under the 72-year confidentiality rule, not only reproduces each question found in every decennial census but also adds the enumerator's instructions for the various entries. Genealogists, historians, researchers, and other users of the manuscript censuses, in particular, will find this information useful.

Issued October 1979, 91 pp. at:\$3.75
